REPORTS ON DAIRY RECORDKEEPING

Years of experience has shown conclusively that dairy record-keeping results in improved dairy herds -- production levels are increased, production efficiency improved, cost of production decreased and returns above feed cost increased. This improvement is measured, however, only from the reports made by the States on the recordkeeping programs. To measure the progress of the National Cooperative Dairy Herd Improvement Program and to use the data collected as a guide for further herd improvement, the following reports must be made:

1. Standard DHIA Reports:

- (a) 305-day lactation records (718's) must be reported on every cow as she completes a 305-day record in a herd if the data are to be obtained for use in the nation-wide proved-sire program to indicate breeding worth of sires and families of animals.
- (b) Yearly herd reports (780's) must be reported on every herd as a record year is completed.

2. Owner-Sampler Reports:

- (a) Yearly herd reports (781's) must be reported on every herd as a record year is completed.

3. Weigh-A-Day-A-Month Reports:

- (a) Yearly herd reports (782's) must be reported on every herd as a record year is completed.

Every DHIA Supervisor, IBM Computing Center, or computing clerk having the responsibility of making the above reports should see that the records of all cows tested are complete and accurate and report them promptly at the end of each record year. Without reports no measure can be made of the progress of the National Cooperative Dairy Herd Improvement Program in the different States and for the United States.

DHIA PROVED-SIRE RECORDS TABULATED IN OCTOBER 1957

Following is a list of 506 sires whose records were tabulated or retabulated by the Animal Husbandry Research Division in October 1957. Production records used in proving DHIA sires consist of 305-day lactation records standardized to a mature equivalent twice-a-day milking basis.

An asterisk at the end of a sire's registration number indicates a retabulated record. The asterisk may be followed by any number from 1 through 15 (i. e., *12) to indicate in which of the 15 printed lists his previous record appeared. Or the asterisk may be followed by the month and year (i. e., *May 51) of the DHIA letter in which his previous record appeared. Two asterisks following the sire's registration number, or following reference to a previous listing, indicate that the proved-sire tabulation or retabulation was requested by one of the States.

In case records from more than one herd were used, the reference is to the herd from which production records for the largest number of the sire's youngest daughters were reported. If the sire has been used in an artificial-breeding association, the name of the association is given.

Proved-sire records consisting of fewer than 10 comparisons are indicated as "preliminary proofs" because these records may be significantly changed when additional comparisons become available and are included in the proved-sire records.

Proved-sire records consisting of fewer than 25 comparisons with daughters resulting from artificial breeding are indicated as "preliminary AB proofs" because these records may be significantly changed when additional comparisons become available and are included in the proved-sire records.

To make the most intelligent selection of a sire, the dairyman should use these proved-sire records to single out the most promising sire and then make every effort to supplement these data with additional information gathered from the herds in which the dams and daughters made their records. Particular attention should be given to the feeding practices and environmental conditions under which the records were made, in order to be assured that the records of the daughters were not made under more favorable conditions than those of the dams or vice versa. It is especially important to determine that there has been no selection of daughters in making the comparison.
